# Introduction

Welcome to the **LBOMETR Course Book!** This book is designed to guide students through the course by providing all necessary resources, materials, and instructions.

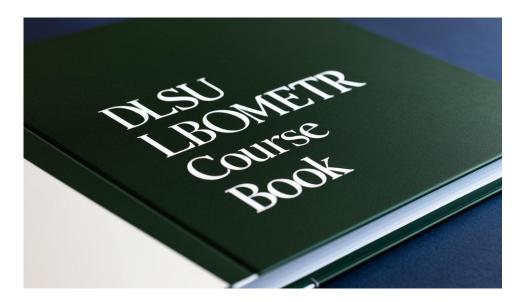

Figure 1.1: LBOMETR

CHAPTER 1. INTRODUCTION

This course book is intended to ensure that DLSU Carlos L. Tiu-School of

Economics students will be able to learn more about Econometrics using

R. You will find sections on the syllabus, course assessments, and group

projects, as well as guidance for navigating the course effectively.

1.1 About Me

6

My name is **Jem Marie M. Nario**, and I am your lecturer for this course. I

am excited to guide you through this journey of learning and discovery since

I am also on a journey of learning and discovery while teaching part-time.

This book is a trial version which will be updated along the course as it also

serves as a practice for me.

• Email: jem.nario@dlsu.edu.ph

• LinkedIn: linkedin.com/in/jmnario/

Feel free to reach out with any questions or concerns throughout the course.

# **Syllabus**

You can download the course syllabus using the link below:

Download Syllabus (Word Document)

### 2.1 Course Description

This course introduces Economics majors to more advanced commands and techniques used in the econometric software package  $\mathbf{R}$ , which is commonly used in empirical research.

### 2.2 Learning Outcomes

### 2.2.1 Knowledge

• To be able to distinguish a theoretical economic model from a statistical econometric model.

- To be able to use the R software package in estimating advanced econometric models.
- To learn advanced econometric models so that students can learn new methods of research.

#### 2.2.2 Skills

- Apply numerical and statistical techniques in economic analysis.
- Use statistical concepts as a language in economic discourse.
- Confidently write script files for economic analysis.

### 2.2.3 Behavior/Attitude

- To imbibe in the student the need for transparency and academic integrity when handling data analysis.
- To allow the student to learn to construct more complex programs from basic commands learned in class.

### 2.3 Grading

### 2.3.1 Grade Components

Component	Weight (%)
Attendance	5%
Group Participation	10%
Data Story Presentation	35%
Data Story Archive	50%

2.3. GRADING

Component Weight (%)

Total 100%

9

### 2.3.2 Grade Scale

Percentage Range	Grade
96 - 100	4.0
90 - 95.99	3.5
84 - 89.99	3.0
78 - 83.99	2.5
72 - 77.99	2.0
66 - 71.99	1.5
60 - 65.99	1.0

### Course Assessments

### 3.1 Data Story Archive

The **Data Story Archive** is the culmination of your group's work throughout the course. It includes your group's data story report, R script, practical assignments, and a group reflection, all compiled into a single professionally formatted PDF file.

### 3.1.1 Requirements

Your submission should follow this structure:

### 1. Cover Page:

• Include the title of the Data Story, group members, and submission date.

#### 2. Table of Contents:

• Provide a clear list of sections with page numbers.

### 3. Data Story Report:

- The complete report should include:
  - **Introduction**: Problem statement and research question.
  - Methods: Data sources, methodology, and analysis techniques.
  - **Results**: Key findings supported by R-generated visuals.
  - Discussion: Implications of the findings and any limitations.
  - Conclusion: Summary and recommendations.
  - Appendix: Supporting tables, additional plots, or materials.

### 4. R Script:

- Render your R script as an HTML using Quarto Markdown.
- Ensure the script is well-structured, commented, and includes outputs like plots and tables.

#### 5. Computer Practicals:

• Include PDFs of all Quarto Markdown files from your computer practicals by printing the html as pdf.

### 6. Group Reflection:

- Write a 1-2 page reflection on:
  - Your teamwork experience (challenges and successes).
  - What you learned from working on the data story.

 How the course contributed to your growth in data analysis and collaboration.

### 3.1.2 Submission

- Combine all the components into a **single PDF** file.
- Name your file as: LBOMETR[Section\_GroupNo.]\_DataStoryArchive.pdf
- **Deadline**: [11 April 2025, 21:00].
- In the event that the file is too big for Animospace, kindly submit as pdf to my email.

### 3.1.3 Grading Rubric for Data Story Archive

The grading rubric for the Data Story Archive is divided into three categories: Content, Analysis and Technical Work, and Overall Presentation Quality.

Category	Criteria	Points	Description

#### 1. Content

Category	Criteria	Points	Description
	Clarity of	10	Clearly defined
	Objective		prob-
			lem/question
			and its relevance
			to the course.
	Data Story	20	Completeness
	Report		and quality of
			the report,
			including
			introduction,
			methods,
			results, and
			discussion.
	Appendix	10	Completeness of
			additional
			materials (e.g.,
			tables, plots) in
			the appendix.
			one appendin.

2. Analysisand TechnicalWork

Category	Criteria	Points	Description
	R Script	15	Well-structured,
	Quality		commented, and
			reproducible R
			script with
			outputs
			rendered as a
			PDF.
	Practical	15	Quality and
	Assignments		completeness of
			PDFs rendered
			from Quarto
			Markdown files.
	Visualizations	15	Clear,
			meaningful, and
			well-designed
			plots and tables
			generated in R.

### 3. Overall

Presentation

Quality

Category	Criteria	Points	Description
	Group	15	Thoughtful
	Reflection		insights on
			teamwork,
			learning, and
			course
			experience.
	Formatting	10	Overall
	and		organization,
	Organization		formatting, and
			adherence to
			submission
			guidelines.
	Total	100	

### 3.2 Data Story Presentation

The **Data Story Presentation** is your group's opportunity to communicate your findings and insights through a live presentation. This format allows you to showcase animated visualizations and engage directly with the audience in real time. A room will be requested for you to be able to present in front of your classmates and I will be present online *hopefully this will be applicable*;

### 3.2.1 Requirements

#### 1. Objective:

- Your live presentation should effectively communicate your data story with clarity, engagement, and professionalism, making full use of visuals and animations to enhance understanding.
- 2. **Presentation Structure**: The presentation must include the following sections:
  - Introduction: Briefly introduce your topic, research question, and the significance of your data story (1 slide).
  - Methods: Provide a concise explanation of your data and analysis methodology (1-2 slides).
  - Results: Highlight the most important findings using R-generated visualizations, including animations if applicable (3-4 slides).
  - **Discussion and Conclusion**: Discuss the implications of your findings and conclude with actionable insights or recommendations (1 slide).

#### 3. **Delivery**:

- Each group member must actively participate in the presentation.
- Presentation duration: 10 minutes, followed by a 5-minute
   Q&A session.

#### 4. Visualizations:

• Use animated or interactive visualizations (e.g., created with gganimate or other R packages) to effectively demonstrate key

trends and insights.

Ensure visuals are clear, professional, and aligned with your narrative.

#### 5. Tools:

- Create your presentation using tools like Google Slides, Microsoft PowerPoint, or Canva.
- Incorporate animated visualizations as needed.

### 6. Submission:

- Submit your presentation slides as a **PDF file** named:

  LBOMETR[Section\_GroupNo.]\_DataStoryPresentation.pdf
- $\bullet\,$  Submit the file before your scheduled presentation time.

### 3.2.2 Grading Rubric

The grading rubric for the Data Story Presentation is divided into three categories: Content, Visualizations, and Delivery and Engagement.

Category	Criteria	Points	Description

#### 1. Content

Category	Criteria	Points	Description
	Introduction	10	Clear and
	and Methods		concise
			introduction and
			explanation of
			methods.
	Results	20	Logical flow and
			depth of results,
			focusing on key
			findings.
	Discussion	10	Insightful
	and		discussion and
	Conclusion		actionable
			conclusion.
2.			
Visualizations			
	Quality of	20	Professional and
	Visuals		well-designed
			visualizations,
			including
			appropriate use
			of animations.

Category	Criteria	Points	Description
	Relevance of	10	Visuals strongly
	Visuals		support the
			analysis and
			enhance
			understanding.
3. Delivery			
and			
Engagement			
	Delivery	20	Confident, clear,
			and professional
			delivery by all
			group members.
	Audience	10	Creativity and
	Engagement		ability to
			maintain
			audience
			attention.
	Q&A Session	10	Ability to
			effectively
			respond to
			audience
			questions.

Category	Criteria	Points	Description
	Time	10	Adherence to
	Management		the 10-minute
			time limit and
			logical pacing.
	Total	100	

# **Grouping Process**

Students will be randomly assigned to groups of **4-5 members** based on their responses to a pre-course survey. The survey collects information that will be used to ensure fair and balanced groupings. The group assignments will be announced on the first day of the course.

### 4.1 Survey

Please complete the survey **before 14:30 PM on January 6, 2025** using the link:

• Google Form Survey Link

### 4.2 How Groups Are Formed

The groupings are created using RStudio. The coding ensures randomness while incorporating some aspects of the survey responses to balance groups.

If you wish to see the code used for grouping, you may contact me directly. However, please note: - The CSV file with survey responses will not be shared to protect your anonymity and privacy.

### 4.3 Announcement of Groups

The group assignments will be distributed on the **first day of the course**. Please check your assigned group and connect with your group members as soon as possible.

Basic Introduction to R

This portion of the book offers an introduction to the basics of R. R offers

a wide variety of functionality. Note that this book only offers basic Econo-

metric analysis. It will be useful to have some basic familiarity with R and

its syntax but this is not strictly necessary.

Each chapter includes both R code and results to make it easier for students

to follow along, even without detailed knowledge of R.

5.1 Session Information

This version of the book was built using R version 4.4.2. See below for the

session information:

## R version 4.4.2 (2024-10-31 ucrt)

## Platform: x86\_64-w64-mingw32/x64

## Running under: Windows 11 x64 (build 22631)

                                                              withr_3.0.2
```

### 5.2 Preliminaries

The first step is to gain access to R, which is free and available on the R website: http://cran.r-project.org/. Simply go to the R website, select the appropriate location and operating system, and follow the instructions to download the base distribution of R. RStudio offers a user friendly environment to run R and is recommended.

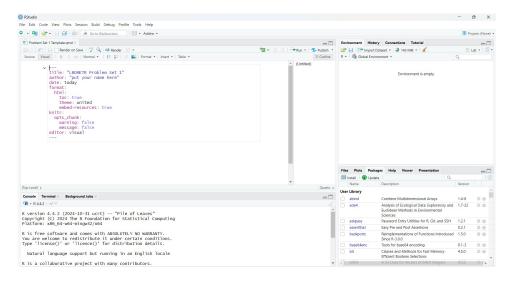

Figure 5.1: RStudio Screen

Once R is opened, we can begin to run commands. R commands can be run directly from the console, from the R script editor or from a text editor separate from R.

R offers detailed help files for each function. To access help, run:

?sum

All lines proceeded by a # are comments and will not run. For example:

# This is a comment. R will not recognize this as a command.

### 5.3 Quarto Markdown

In LBOMETR, Quarto Markdown will be used by the students when submitting the Scripts for the Data Story Archive. Quarto Markdown is a tool for creating documents, reports and presentations using Markdown and executable code. Below is a concise guide to help you get started, along with key shortcuts for both Mac and Windows.

### 5.3.1 1. Starting a Quarto File

To begin creating a Quarto document, follow these steps:

- 1. Open RStudio.
- 2. Go to File > New File > Quarto Document.
- 3. Choose the document type (e.g., HTML, PDF, Word, etc.) and specify whether the document will include code. For ease, we will use the html document type. I have also added a sample Quarto Markdown file you can copy.

Quarto Markdown Template

### 5.3.2 2. Quarto Key Features

#### **Code Chunks**

Code chunks allow you to include and run code inside your document.

### Inline Code

Embed R code in text using backticks and  ${\tt r}$  .

### 5.3.3 Quarto Markdown Shortcuts

Action	Windows Shortcut	Mac Shortcut
Insert a new	Ctrl+Alt+I	Cmd+Alt+I
code chunk		
Run current	Ctrl+Shift+Enter	$\operatorname{Cmd+Shift+Enter}$
code chunk		
Run all code	Ctrl+Alt+R	Cmd+Alt+R
chunks		
Run current	Ctrl+Enter	Cmd+Enter
line/selection		
Knit/Render	Ctrl+Shift+K	Cmd+Shift+K
document		
Comment/uncon <b>Chri</b> ntShift+C		Cmd+Shift+C
lines		
Insert pipe	Ctrl+Shift+M	Cmd+Shift+M
(%>%)		
Headings	/Number of Heading (if in	/Number of Heading (if in
	Visual mode)	Visual mode)
	Prefix line with $\#$ , $\#$ #,	Prefix line with $\#$ , $\#$ #,
	etc. manually (in Source	etc. manually (in Source
	mode)	mode)

Action	Windows Shortcut	Mac Shortcut
Bold	Ctrl+B	Cmd+B
Italic	Ctrl+I	$\operatorname{Cmd}+\operatorname{I}$
Inline code	Surround with backticks (')	Surround with backticks (')
	manually	manually

<sup>\*</sup>Note: you can choose between Source or Visual (upper left); personally, it is easier for me to use the Visual Mode compared to the Source Mode.

### 5.4 Packages

Each package of interest must be installed and loaded before it can be used. The packages will not be immediately available when R is opened. A package only has to be installed once on a computer, but the package will have to be loaded every time R is restarted.

We can install a package individually as we need them. For example, to install **tidyverse** and **psych**, we would do:

```
install.packages("tidyverse")
install.packages("psych")
```

In the tidyverse package, the **ggplot2** is usually included; if you do not see the package in the Packages list at the lower right, you can do this: 5.4. PACKAGES 31

```
if(!("ggplot2" %in% installed.packages()[,"Package"])) install.packages("ggplot2")
```

Now that we have our packages successfully installed, we can go ahead and load them into R. Here we will load the tidyverse package as an example. We can use of all the functions available in that package once it is loaded into R. We load packages by using a library() function. The input is the name of the package, not in quotes.

```
library(tidyverse)
```

We can look up all of the functions within a package by using a help() function. For example, let's look at the functions available in the tidyverse package.

```
help(package = tidyverse)
```

Note that the package argument is necessary to look up all of the functions. We can also detach a package if we no longer want it loaded. This is sometimes useful if two packages do not play well together. Here we will use a detach() function.

```
detach(package:tidyverse)
```

For simplicity, we will assume that the reader has restarted R at the beginning of each tutorial.

# 5.5 Instructions for Managing Working Directories

This guide outlines how team members should set up their local working directories for collaboration, handle .qmd files, and organize them in a shared Google Drive.

### 5.5.1 1. Local Working Directory Setup

Each team member should create a local folder on their own laptops to work on qmd files. This folder is where you will store and edit your files before uploading them to the shared Google Drive.

### 5.5.1.1 Steps:

- 1. Create a folder on your laptop named: **DLSU\_LBOMETR\_Section**
- 2. Use this folder to save and organize your .qmd files while working locally.

### 5.5.2 2. File Naming Convention

To avoid confusion, ensure all .qmd files are named as follows:

- Include your name or initials and a brief description of the content
- Example:
  - jem\_nario\_descriptivestatistics.qmd
  - jmn\_piechart.qmd

#### 5.5. INSTRUCTIONS FOR MANAGING WORKING DIRECTORIES 33

### 5.5.3 3. Shared Google Drive Setup

A shared Google Drive will serve as the central repository for all project files, including:

- .qmd files from all team members
- Data files
- Rendered HTML and PDF files for final submission
- Supporting documents or references.

### 5.5.4 4. Workflow for .qmd files

#### For each team member:

- 1. Work locally
  - Create your .qmd file in your local DLSU\_LBOMETR\_Section folder
  - Ensure it is well-documented and organized.
- 2. Upload to Google Drive

#### For the Team Leader:

- 1. Collect and Combine Files
  - Gather all .qmd files from the team folder on the shared drive.
  - Combine them
- 2. Render the final report

### 5.5.5 5. Rendering the Final Report

The final report should be rendered in HTML and printed by the team leader.

### 5.5.6 Summary Workflow

#### • Each Team Member:

- Work on your .qmd file locally.
- Upload your file to the shared Google Drive under team-members-qmd.

### • Team Leader:

- Collect .qmd files from the shared drive.
- Combine them into a single final\_report.qmd.
- Render the final report into HTML and PDF.
- Upload the rendered files to the final-report folder on the shared Google Drive.

This ensures an organized and efficient workflow while centralizing all files in the shared Google Drive for easy access and submission.

# Data Management -

# **Cross-Sectional Data**

### 6.1 Where to Get Data?

Before we proceed to Data Management, let us first find where we can get data for the Data Story Archive. Note that the data you collect should still ensure that you are following the Code of Ethics and analyze Ethical Considerations.

Please view the necessary documents from the Office of the Vice Chancellor for Research and Innovation (https://www.dlsu.edu.ph/research/research-manual/)

A list of links you can search and get data from:

Note: I will not include the best links as they are pretty straightforward and these are governmental databases like the ones from World Bank, IMF,

### 36 CHAPTER 6. DATA MANAGEMENT - CROSS-SECTIONAL DATA

UN, Philippine Statistics Authority, and Bangko Sentral ng Pilipinas. The list here is a general list but use with proper discretion.

Name	Link	Notes
Kaggle	https://www.kaggle.	Kaggle is where users
	com/datasets	can provide datasets; it
		is important to cite the
		sources. Mostly,
		datasets in Kaggle can
		be used for your
		practice.
Awesome Public	https://github.com/	This repository is filled
Datasets	awesomedata/	with public datasets,
	awesome-public-	mostly from
	datasets	International contexts.
Google Dataset Search	https://datasetsearch.	You can download
	${\it research.google.com/}$	publicly available
		datasets from searching
		through Google.
		Though, sometimes the
		datasets come from
		'Statista.com'. You can
		check the sources from
		the search.

#### 6.2 Preliminaries

#### 6.2.1 Dataset

The dataset to be used can be downloaded here: Chapter Practice and will be included in the Files in Animospace. The dataset was modified from the Wooldridge package in R as practice material. The particular dataset is the 'htv' dataset.

#install the wooldridge package. Check previous chapter on how to install packages.
load(wooldridge)
?htv #to find out about the particular dataset.

NOTE: The htv dataset help will tell you what the variables mean, however, for our practice, we will use the modified version of this dataset.

#### 6.2.2 Packages

We will mostly use the tidyverse package, in particular, the dplyr package and the tidyr package; double-check in your Packages list whether you have these two packages; if not, you can simply install them.

#### 6.2.3 Setting up the Directory

This is the most important step! Make sure to place the downloaded file in this folder: **DLSU\_LBOMETR\_Section** in your laptops. Remember, this is your local working directory. This is the working directory you choose. You can set up your working directory in the following ways:

- 1. Using the R Studio Menu (works for both Mac and Windows)
  - a. Go to Session > Set Working Directory > Choose Working Directory
- 2. Windows:

```
# Use double backslashes `\\` or forward slashes `/`
setwd("C:\\Users\\YourUsername\\Documents") # Example with backslashes
setwd("C:/Users/YourUsername/Documents") # Example with forward slashes
```

3. Mac

```
# Use forward slashes `/`
setwd("/Users/YourUsername/Documents")
```

To check:

```
getwd()
```

#### 6.2.4 Clean Everything

Do this step every time you use other data or when we do the other chapters.

```
# Remove all objects in the global environment
rm(list = ls())

# Perform garbage collection to free up memory
gc()
```

```
## used (Mb) gc trigger (Mb) max used (Mb)
## Ncells 2124855 113.5 3349050 178.9 3349050 178.9
## Vcells 5020557 38.4 10146329 77.5 10146329 77.5
```

#### 6.2.5 Importing the Dataset

We can use the read.csv() to load the csv file into R. Always call the file as something short and easily understandable. Ensure the downloaded file is in the working directory before you load the file. If the downloaded file is not located in the working directory, you will encounter issues.

I will name the file as ch2\_p1

```
ch2_p1<-read.csv("Ch2Practice.csv")
```

We can use the head() function to inspect the first six rows of the dataset:

```
head(ch2_p1)
```

##		WAGE	ABILITY	EDUCATION	NORTHEAST	NORTHCENTRA	AL WEST	SOUTH	EXPERIENCE	MOTHE	REDUC
##	1	12.019231	5.027738	15	no	r	no yes	no	9		12

#### 6.3 Data Cleaning

As you can see, there are 22 columns. Let's simplify by only choosing the following: WAGE, URBAN, X17TUITION, X18TUITION and EXPER.2. We can do this using the select() function in dplyr. We will save them into a new data frame, ch2\_p1.1.

```
library(dplyr)
```

```
ch2_p1.1<-select(ch2_p1, #the original dataset

WAGE, URBAN, X17TUITION, X18TUITION, EXPER.2)
```

#### 6.3.1 Renaming the Variables

We will edit the names to much easier conventions. First, let us say that we just want to change them to lowercase names.

```
names(ch2_p1.1)<-tolower(names(ch2_p1.1))
```

Inspect:

```
head(ch2_p1.1)
```

```
##
          wage urban x17tuition x18tuition exper.2
## 1 12.019231
                       7.582914
                                   7.260242
                                                  81
                 yes
## 2 8.912656
                       8.595144
                                   9.499537
                                                  64
                 yes
## 3 15.514334
                       7.311346
                                   7.311346
                                                121
                 yes
## 4 13.333333
                       9.499537 10.162070
                                                  36
                 yes
## 5 11.070110
                 yes
                       7.311346
                                   7.311346
                                                225
## 6 17.482517
                 yes
                       7.311346
                                   7.311346
                                                  64
```

Let us change the names of x17tuition, x18tuition, and exper.2 to the names similar to what is found in the 'htv' dataset: x17tuition to tuit17, x18tuition to tuit18 and exper.2 to expersq. To do this, we will use the rename() in dplyr. We will also use the (%>%) for this.

```
ch2_p1.1<-ch2_p1.1 %>%
  rename(
   tuit17 = x17tuition,
  tuit18 = x18tuition,
```

```
expersq = exper.2
)
```

Inspect again:

```
head(ch2_p1.1)
```

```
##
         wage urban
                      tuit17
                                tuit18 expersq
                yes 7.582914 7.260242
## 1 12.019231
                                            81
## 2 8.912656
                yes 8.595144 9.499537
                                            64
## 3 15.514334
                yes 7.311346 7.311346
                                           121
## 4 13.333333
                yes 9.499537 10.162070
                                            36
## 5 11.070110
                                           225
                yes 7.311346 7.311346
## 6 17.482517
                yes 7.311346 7.311346
                                            64
```

#### 6.3.2 Sorting certain values

Let's say, we want to arrange wage. We will create a different data for this. We use arrange in dplyr package.

```
ch2_p1sort<-arrange(ch2_p1.1, wage)
```

Inspect:

```
head(ch2_p1sort)
```

## wage urban tuit17 tuit18 expersq

```
## 1 1.023529
               yes 2.088957
                              2.251239
                                           169
## 2 1.073345
                no 7.520245
                              7.520245
                                           196
## 3 1.102362
               yes 7.355460
                              6.922371
                                           196
## 4 1.250000
               yes 9.417682 8.826549
                                           100
## 5 1.373626
               yes 9.692757 9.692757
                                           225
## 6 1.442308
                no 11.280367 11.280367
                                            NA
```

What if you have this kind of data?

```
head(ch2_p2)
```

```
## ch2_p2
## 1 $10,000
## 2 $20,500
## 3 $15,250
## 4 $30,000
## 5 $50,750
```

Let's sort this:

```
ch2_p2sort<-arrange(ch2_p2)
head(ch2_p2)</pre>
```

```
## ch2_p2
## 1 $10,000
## 2 $20,500
## 3 $15,250
## 4 $30,000
## 5 $50,750
```

It did not work. The problem is, ch2\_p2 is not numeric. We can check:

```
class(ch2_p2$ch2_p2)
```

```
## [1] "factor"
```

We need to make it into a numeric value but we have a , and \$. We need to remove them. We use the str\_replace function in the stringr package.

#### library(stringr)

```
ch2_p2$ch2_p2<-str_replace(
   ch2_p2$ch2_p2, #column we want to edit
   pattern = ',', #what to find
   replacement = '' #what to replace it with
)</pre>
```

### head(ch2\_p2)

```
## ch2_p2
## 1 $10000
## 2 $20500
## 3 $15250
## 4 $30000
## 5 $50750
```

Now, let us remove the dollar sign; usually, simply doing the same thing we did with the comma works, but, there are some symbols that are used as

"special character". To "force" R to replace the presence of '\$', we add two backslashes before the dollar sign.

```
ch2_p2$ch2_p2<-str_replace(
  ch2_p2$ch2_p2,
  pattern = '\\$',
  replacement = ''</pre>
```

Can you inspect it on your own?

Simply type the code in the empty code chunk then run it by pressing Ctrl+Enter or Cmd+Enter

Now, sort ch2\_p2

```
ch2_p2sort<-arrange(
  ch2_p2,
  ch2_p2
)</pre>
```

```
head(ch2_p2sort)
```

```
## ch2_p2
## 1 10000
## 2 15250
## 3 20500
## 4 30000
## 5 50750
```

We can see that it was arranged, however, take a look at the way ch2\_p2 was encoded; it is not numeric. So, we need to change this.

```
class(ch2_p2$ch2_p2)
```

```
## [1] "character"
```

Change to numeric through as.numeric()

```
ch2_p2\$ch2_p2\ch2_p2\ch2_p2\$ch2_p2)
```

Inspect on your own:

#### 6.3.3 Pipe Operator

%>% allows functions to be chained; it can be read as "then" - it tells R to do whatever comes after it to the stuff that comes before it.

#### 6.3.4 Adding columns

We will be using the pipe operator and the mutate to add a new column to ch2\_p1.1 based from details found in ch2\_p1, particularly, NORTHEAST, NORTHCENTRAL, WEST, and SOUTH. We will call this new column as location

```
ch2_p1.1<-ch2_p1.1 %>%
mutate(
   location = case_when( #creates conditional statements
```

```
ch2_p1$NORTHEAST == "yes" ~ "northeast", #If NE is "yes", location is "northeast"
ch2_p1$WEST == "yes"~"west", #If WEST is "yes", location is "west"
ch2_p1$NORTHCENTRAL == "yes"~ "northcen",
    ch2_p1$SOUTH == "yes"~ "south",

TRUE~"other")
)
```

Inspect the data:

Now I want you to create a new column called, tuit\_diff wherein it is the difference between tuit18 and tuit17. In this case, there is no need to use case\_when since there is no conditional statements to be used. It is straightforward that you simply need to subtract tuit17 from tuit18. You will need to use mutate still. How will you create that?

#### 6.3.5 Transforming values

Now, you can see that urban is a character that is "yes/no". We need to change that to numeric value. This is particularly useful when we use dummy variables later on. We will not use case\_when as it is not necessary; rather, we will use ifelse:

```
ch2_p1.1<-ch2_p1.1 %>%
  mutate(
    urban = ifelse(urban=="yes", 1,0) #replace "yes" with 1 and "no" with 0
)
head(ch2_p1.1) #default is first 6 rows
```

location	${\tt expersq}$	tuit18	tuit17	urban	wage		##
west	81	7.260242	7.582914	1	12.019231	1	##
northeast	64	9.499537	8.595144	1	8.912656	2	##
northeast	121	7.311346	7.311346	1	15.514334	3	##
northeast	36	10.162070	9.499537	1	13.333333	4	##
northeast	225	7.311346	7.311346	1	11.070110	5	##
northeast	64	7.311346	7.311346	1	17.482517	6	##

Now, I want you to create groups for expersq. NA should now be 0, assign 1 if less than 50, assign 2 if between 50 and 100, assign 3 if between 100 and 200, and for the rest, assign 4.

Clue: conditional statements like between 50 and 100 should be like this:

values>=50 & values < 100

Your answer should look like this:

location	expersq	tuit18	tuit17	urban	wage		##
west	2	7.260242	7.582914	1	12.019231	1	##
northeast	2	9.499537	8.595144	1	8.912656	2	##
northeast	3	7.311346	7.311346	1	15.514334	3	##
northeast	1	10.162070	9.499537	1	13.333333	4	##
northeast	4	7.311346	7.311346	1	11.070110	5	##
northeast	2	7.311346	7.311346	1	17.482517	6	##

#### 6.3.6 Summarizing

Let us get the average of wages by location, which we'll call ave.wage, by using the group\_by() and summarise() functions in dplyr

```
ch2_p1.1ave<-ch2_p1.1 %>%
    group_by(location) %>% #group by location, THEN
    summarise(ave.wage=mean(wage)) #calculate the mean of wages for each location
head(ch2_p1.1ave)
```

Say that you want to see the average wage in the south area. We can do this by using filter()

```
ch2_p1.1ave %>% filter(location=="south")
```

```
## # A tibble: 1 x 2
## location ave.wage
## <chr> <dbl>
## 1 south 12.4
```

How would you sort the dataset by average wage, from highest to lowest? Now you see that it is arranged alphabetically, so how will you arrange it?

#### 6.3.7 Merging datasets

We have two main datasets, ch2\_p1.1 and ch2\_p1.1ave. By doing this, we could compare side-by-side each observation compared to the average per location.

We will join the datasets by location variable, since that is consistent across both datasets. We name the new file as ch2\_p1merged:

```
ch2_p1merged<-merge(x=ch2_p1.1, y=ch2_p1.1ave, by="location")
head(ch2_p1merged)</pre>
```

```
##
     location
                   wage urban
                                tuit17
                                         tuit18 expersq ave.wage
## 1 northcen 15.294118
                            1 8.334936 8.334936
                                                      3 12.54078
## 2 northcen 17.006804
                            1 8.334936 8.334936
                                                      0 12.54078
## 3 northcen 3.755868
                            1 8.334936 8.334936
                                                      3 12.54078
## 4 northcen 5.288462
                            1 6.742574 7.198132
                                                      2 12.54078
## 5 northcen 9.072165
                            1 7.305873 7.356897
                                                      0 12.54078
## 6 northcen 9.384164
                            1 8.334936 8.334936
                                                      3 12.54078
```

#### 6.3.8 Splitting datasets

Say I want to save different datasets based on the location column.

```
northcen_data<-ch2_p1.1 %>% filter(location=="northcen")
```

You can save it as a .csv file:

```
write.csv(northcen_data, "northcentral.csv", row.names = FALSE)
```

Can you do the others?

#### 6.3.9 Dates

We are going to work on dates when we move to the next chapter but, here is something initial and necessary.

```
ID date_of_birth
##
## 1 1
           15-05-1990
## 2
      2
           20-08-1985
## 3
           01-12-2000
     4
           10-03-1995
## 4
## 5 5
           25-07-2010
## 'data.frame':
                    5 obs. of 2 variables:
##
   $ ID
                   : int 12345
   $ date_of_birth: chr "15-05-1990" "20-08-1985" "01-12-2000" "10-03-1995" ...
To convert the character format to date format, we do this:
date_data$date_of_birth <- as.Date(date_data$date_of_birth, format = "%d-%m-%Y")</pre>
head(date_data)
```

```
## ID date_of_birth
## 1 1 1990-05-15
```

#### 52 CHAPTER 6. DATA MANAGEMENT - CROSS-SECTIONAL DATA

```
## 2 2 1985-08-20
## 3 3 2000-12-01
## 4 4 1995-03-10
## 5 5 2010-07-25
```

Say you want to calculate the age:

```
date_data$age <-as.numeric(floor((Sys.Date()-date_data$date_of_birth)/365.25))
head(date_data)</pre>
```

```
## ID date_of_birth age
## 1 1 1990-05-15 34
## 2 2 1985-08-20 39
## 3 3 2000-12-01 24
## 4 4 1995-03-10 29
## 5 5 2010-07-25 14
```

#### 6.3.9.1 Custom Reference Date:

## 3 3 2000-12-01 24

```
ref_date<-as.Date("2020-01-01")
date_data$age2<-as.numeric(floor((ref_date-date_data$date_of_birth)/365.25))
head(date_data)

## ID date_of_birth age age2
## 1 1 1990-05-15 34 29
## 2 2 1985-08-20 39 34</pre>
```

19

## 4 4 1995-03-10 29 24

**##** 5 5 2010-07-25 14 9

#### 54 CHAPTER 6. DATA MANAGEMENT - CROSS-SECTIONAL DATA

## Chapter 7

## Data Management Practical

In your Quarto Markdown files, you need to answer the following questions. Answers will be given the week after the Practical as a form of Feedback. You can answer by group. It would be great to include which group member did what.

In the first part of the practical, answer the following reflection:

1. Do you think you were able to input correctly all the codes in the empty code chunks? Why do you think so? What did you find difficult?

Now comes the practical proper:

Using the kpop idols dataset which you download: Practical 1 - also made available in Animospace, answer the questions.

Ensure that you can render individually before uploading in your shared Google Drive. Failure to render the file means you were unable to do the 56

Practical. The leader must take note of this since accomplishing the prac-

ticals are part of your grade in Group Participation and the Data Story

Archive.

1. Separate the dataset into two datasets: one for males and one for

females. Save these datasets as males.csv and females.csv

2. Edit the column names for both males and females datasets to make

them shorter, easier to understand, and consistent

3. Remove the following columns from both datasets: Instagram, Korean

Name, K.Stage Name, Stage Name

4. How many males and females are in the dataset? *Hint:* nrow()

5. Create a binary variable not\_seoul for both datasets.

1. Assign 1 if birthplace is **not Seoul**, and 0 otherwise

2. Count how many individuals are from Seoul and how many are

not for both datasets.

6. How many males are eligible for military service (ages 18-28 as of

February 27, 2024)?

1. Filter the males dataset for this age range, how many from the

Country of South Korea (only filter according to Country for

straightforwardness) and count how many qualify.

7. Assign generations based on age (as of June 29, 2023 when the Korean

Age system was abolished) for both datasets.

1. Generation criteria:

1. 1st Gen: Age>=40

2. 2nd Gen: 31<=Age<=39

3. 3rd Gen: 25 <= Age <= 30

4. 4th Gen: Age<=24

Count the number of individuals in each generation for males and females

- 8. Create a new column income for both datasets using hypothetical values based from your hypothesis on age influencing income levels of idols. Explain first what your hypothesis is are idols who are older earning more or less? Why or why not? Also think if you believe females earn more than males or vice versa?
  - 1. Use **set.seed()** for reproducibility and generate random income values.
    - 1. Please have different income values depending on their age. You can do similar groupings as Step 7 for this.
  - 2. Compare the mean income
- 9. Combine the males and females datasets
- 10. Calculate the income difference between males and females
  - Create a column income\_diff to calculate how much more or less each individual's income is compared to the average income of the other gender.
- 11. Save the final dataset named Ch2\_Practical\_Section\_GrpNo.csv

## Chapter 8

# Data Management (Cross-Sectional) Feedback

This feedback will contain only what the answers should look like and some clues and hints. It does not contain the entire codes.

1. Loading the dataset and loading the needed libraries: dplyr and lubridate

```

#### 3. Edit Column Names and Remove Unnecessary Columns

We are going to use the pipe operator for this and if you are lazy to type all the

```
#only those that remain
#col<-c("Full.Name.Full.Name", "Date.of.Birth.Date.of.Birth"...)</pre>
```

THEN, after you select the columns to keep, you can rename. Note that you need to

## Full\_Name DOB Grp Country Ht Wt BP Gender ## 1 Kim Taeyeon 3/9/1989 SNSD South Korea 160 44 F Jeonju Lee Sunkyu 5/15/1989 SNSD South Korea 158 43 F California F ## 3 Hwang Miyoung 8/1/1989 SNSD South Korea 163 50 San Francisco ## 4 Kim Hyoyeon 9/22/1989 SNSD South Korea 158 48 F Incheon

## 2	Dong Youngbae	5/18/1988	BIGBANG	South Ko	orea 174	56	Uljeongbu	M
## 3	Kwon Jiyong	8/18/1988	BIGBANG	South Ko	orea 177	58	Seoul	M
## 4	Daesung	4/26/1989	BIGBANG	South Ko	orea 178	63	Incheon	M
## 5	Lee Seunghyun	12/12/1990		South Ko	orea 176	60	Gwangju	M
## 6	Park Jeongsu	7/1/1983	Super Junior	South Ko	orea 179	59	Seoul	M

#### 4. Count the Number of Males and Females

As mentioned, use nrow. Now, I will introduce you to the cat function, The cat function will print in the result some text and what will be seen when you include the object you created that reveals the number of males (or females). We should all have the same number. If not, something is wrong.

```
#cat("Number of males:", nummale,"\n")
```

## Number of males: 843

## Number of females: 823

5. Create a binary variable not\_seoul

#### 64CHAPTER 8. DATA MANAGEMENT (CROSS-SECTIONAL) FEEDBACK

Here, create a new column for not\_seoul in both males and females.

Use ifelse and the statement should include !=

#### 6. Count Individuals from and not from Seoul

I introduce the count function. Simply add count after choosing the dataset. So, the code is choose males THEN count those that are not seoul. We should have the same number.

## Males from Seoul and not Seoul:

## From Seoul: 98

## Not from Seoul: 745

## Females from Seoul and not Seoul:

## From Seoul: 108

## Not from Seoul: 715

#### 7. Filter Males Eligible for Military Service

Use reference date and when you filter, you can actually combine filtering the Age to be: Age>= 18, Age<=28, Country == "South Korea". We should have the same number.

## Number of males eligible for military service: 496

8. Assign Generations Based on Age

We should have the same numbers. If you have created an Age column for males before, you cannot use that for this number since the reference dates are different. You need to create a new column for Age for both males and females.

#### ## Generation distribution for males:

## 1st Gen: 8

## 2nd Gen: 137

## 3rd Gen: 358

## 4th Gen: 340

#### ## Generation distribution for females:

## 1st Gen: 4

## 2nd Gen: 131

## 3rd Gen: 302

## 4th Gen: 386

#### 9. Create Income Column Based on Hypothesis

My hypothesis is that older idols earn more since they have been in the industry much longer. I also hypothesize that females earn less than males.

I introduce a new function here, it is the runif(n(), value, value). This function is to just create income values which will be in-line with the number of rows in the dataset. However, I am amenable in any strategy you employ to generate income here. I just need to know your hypothesis and how you plan to do the income column. In fact, if you

want, you can even create the income column in Excel already. Just let me know.

Another strategy is to still do case\_when and have smaller increments in Age then have income values. Another, have the same income for each generation, that is also fine. Again, this is for practice purposes.

```
# Generate income values based on age group directly
set.seed(123) # For reproducibility
males <- males %>%
  mutate(Income = case_when(
    Age2 >= 40 ~ runif(n(), 50000, 70000), # 1st Gen
    Age2 >= 31 & Age2 <= 39 ~ runif(n(), 40000, 60000), # 2nd Gen
    Age2 >= 25 & Age2 <= 30 ~ runif(n(), 30000, 50000), # 3rd Gen
    Age2 <= 24 ~ runif(n(), 20000, 40000) # 4th Gen
  ))
females <- females %>%
  mutate(Income = case_when(
    Age2 >= 40 ~ runif(n(), 50000, 70000), # 1st Gen
    Age2 >= 31 & Age2 <= 39 ~ runif(n(), 40000, 60000), # 2nd Gen
    Age2 >= 25 & Age2 <= 30 ~ runif(n(), 30000, 50000),
    Age2 \leq 24 ~ runif(n(), 20000, 40000) # 4th Gen
  ))
```

#### 10. Combine datasets

So, I taught you how to merge the datasets. You can do that as well,

however, it is important to determine which came from the males, which came from the females so, you need to create a new column in the males and the females that would include the Gender.

I also show a different way of merging datasets. I use bind\_rows since males and females have the same columns. However, if you view the combined dataset, you will notice that the females will appear after the males. This is fine.

```
# Ensure column names match and add a Gender column
males <- males %>% mutate(Gender = "Male")
females <- females %>% mutate(Gender = "Female")

# Combine the datasets
combined <- bind_rows(males, females)

# View the combined dataset
View(combined)</pre>
```

#### Calculate the Income Difference

I use the group\_by function and the summarise function. I got the Mean and the Median. Later on, I will discuss the difference between getting the mean and the median or when best to use the mean or the median.

#### 68CHAPTER 8. DATA MANAGEMENT (CROSS-SECTIONAL) FEEDBACK

- ## 2 Male 37907. 37246.
- ## The gender with the higher mean income is: Male
- ## The gender with the higher median income is: Male
  - 11. Now that we have the combined dataset, simply save it as a CSV file and you are done with the practical.

## Chapter 9

## Data Management - Time Series and Panel Data

For this portion of the discussion, we will use one dataset then generate randomly here in R some practice data frames.

#### 9.1 Topic Guide:

- 1. Changing from daily to monthly to quarterly to yearly
- 2. Change from long to wide and vice-versa
- 3. Missing values

#### 9.2 Time Series Data

For this, we will use Chapter3 Practice found in the Modules.

#### 9.2.1 Preliminaries

Always remember the first steps: Set Working Directory and Clean the Global Environment.

```
rm(list=ls())
gc()
```

```
## used (Mb) gc trigger (Mb) max used (Mb)
## Ncells 2124709 113.5 3349050 178.9 3349050 178.9
## Vcells 5042446 38.5 10146329 77.5 10146329 77.5
```

To make sure that you are using the correct directory and that you have all the files you need, use list.files() function.

```
list.files()
```

Now, we load the following packages: dplyr, lubridate, and zoo. Make sure you have all 3 installed; if not, install them.

```
library(dplyr)
library(lubridate)
library(zoo)
```

Now we load the csv file:

```
ch3_p1<-read.csv("Ch3Practice.csv")
head(ch3_p1)</pre>
```

```
## ds y

## 1 2015-06-13 232.402

## 2 2015-06-14 233.543

## 3 2015-06-15 236.823

## 4 2015-06-16 250.895

## 5 2015-06-17 249.284

## 6 2015-06-18 249.007
```

We need to understand our data;

```
str(ch3_p1)
## 'data.frame': 1825 obs. of 2 variables:
## $ ds: chr "2015-06-13" "2015-06-14" "2015-06-15" "2015-06-16" ...
## $ y : num 232 234 237 251 249 ...
```

#### 9.2.2 Convert to Date Format

As you can see, our ds is what our date column is, however, it is in the character format. We need to convert it to the Date class. We also need to do this to a copy of the raw data for further modifications.

```
ch3_p1.1<-ch3_p1
head(ch3_p1.1$ds)
```

```
## [1] "2015-06-13" "2015-06-14" "2015-06-15" "2015-06-16" "2015-06-17" "2015-06-18"
```

```
class(ch3_p1.1$ds)

## [1] "character"

ch3_p1.1$ds <- as.Date(ch3_p1.1$ds, format = "%Y-%m-%d")

class(ch3_p1.1$ds)

## [1] "Date"</pre>
```

#### 9.2.3 Aggregate Data

We now have daily data. Say we want to create weekly data, we use the cut function to group dates by week, month, quarter and year.

Since we know for sure that the date column is in date format, no need to check, however, it is always useful to check the class of date.

#### 9.2.3.1 Aggregate by Week

Add new columns for each aggregation.

```
ch3_p1.1$week<-cut(ch3_p1.1$ds, breaks = "week")
```

The cut is used to divide the date into intervals while the breaks specifies that the date be divided into weekly intervals.

Check creation of the week column

```
head(ch3_p1.1)
```

```
## ds y week

## 1 2015-06-13 232.402 2015-06-08

## 2 2015-06-14 233.543 2015-06-08

## 3 2015-06-15 236.823 2015-06-15

## 4 2015-06-16 250.895 2015-06-15

## 5 2015-06-17 249.284 2015-06-15

## 6 2015-06-18 249.007 2015-06-15
```

Since we have the y column which is actually Bitcoin Price, we need to aggregate that weekly using the aggregate function

You will notice that this creates a separate data frame. We will merge week\_y with ch3\_p1.1

```
ch3_p1.1<-merge(ch3_p1.1, week_y, by = "week", #ensures the merge aligns based on the wee suffixes = c("","_weekly")) #adds _weekly to the column name to distingui
```

We will slightly do the same thing when aggregating by month, quarter and year. I will do the initial steps, but please do the succeeding steps on your own.

### 9.2.3.2 Aggregate by Month

```
# Add a month column
ch3_p1.1$month <- format(ch3_p1.1$ds, "%Y-%m")
# Calculate monthly means</pre>
```

```
# Calculate monthly means
month_y <- aggregate(. ~ month, data = ch3_p1.1, FUN = mean)</pre>
```

## 9.2.3.3 Aggregate by Quarter

This is different since we will use the pasteO and the format functions. The format function extracts the year from the date and extracts the quarter from the date. The pasteO combines the year and quarter without a space between them so that it results in which quarter of which year.

```
ch3_p1.1$quarter <- paste0(format(ch3_p1.1$ds, "%Y"), " ", quarters(ch3_p1.1$ds)
```

#### 9.2.3.4 Aggregate by Year

```
ch3_p1.1$year<-format(ch3_p1.1$ds, "%Y")
```

Can you aggregate the Bitcoin values on your own?

# 9.3 Modifying Long and Wide Datasets

#### 9.3.1 How to Determine

Aspect	Long Format	Wide Format
Rows	Each row represents a	Each row represents an
	single observation (or	entity (like a group)
	measurement)	
Columns	Variables are split into	Variables are spread
	multiple rows	across multiple
		columns
Compactness	More rows, fewer	Fewer rows, more
	columns	columns

#### 9.3.1.1.2.2 Wide Format

Date	City A	City B
2023-01-01	15	20
2023-01-02	16	21

# 9.3.2 Setting up the Dataset

## 9.3.2.1 Generate a Long Dataset

For practice, we will generate a long dataset. We will need set.seed for reproducibility when you want to run the entire code again and to generate

random values, we will use the rnorm function.

```
#Generate a long dataset
long<-data.frame(
  id = rep(1:5, each = 3), #creates 5 groups and repeated 3 times each
  variable = rep(c("A", "B", "C"), times=5), #Variables A,B,C are created and repeated 5
  value = rnorm(15, mean = 50, sd = 10) #creates random values for 15 observations with m
)
print(long)</pre>
```

```
##
      id variable
                     value
## 1
               A 44.39524
       1
## 2
               B 47.69823
               C 65.58708
## 3
## 4
       2
               A 50.70508
## 5

               B 51.10683
```

## 15 5 C 44.44159

## 9.3.2.2 Converting Long to Wide Format

We will use the pivot\_wider() function from the tidyr package.

```
library(tidyr)

wide<-pivot_wider(
   data = long,
   names_from = variable, #Columns to become new column names
   values_from = value #Values to put under new columns
)

print(wide)</pre>
```

```
## # A tibble: 5 x 4
##
       id
             Α
                  В
    <int> <dbl> <dbl> <dbl>
##

## 9.3.2.3 Convert Wide to Long

We will use the converted wide dataset for this. We will use the pivot\_longer function.

```
long2<-pivot_longer(
  data = wide,
  cols = A:C, #Which columns to collapse
  names_to = "variable", #New column for variable names
  values_to = "value" #new column for values
)
print(long2)</pre>
```

```
## # A tibble: 15 x 3
##
         id variable value
      <int> <chr>
                       <dbl>
##
          1 A
                       44.4
##
    1
    2
                        47.7
##
          1 B

## 14 5 B 51.1

## 15 5 C 44.4
```

# 9.4 Missing Values

In handling missing values in R, we focus on 3 common methods:

- 1. Replacing missing values with 0
- 2. Removing rows or columns with missing values
- 3. Replacing missing values with the mean

## 9.4.1 Setting up a Sample Dataset

```
set.seed(123)
ch3_p2<-data.frame(
  id = 1:5,
  var1 = c(10, NA, 30, 40, NA),
  var2 = c(NA, 15, 25, 35, 45),
  var3 = rnorm(5, mean = 50, sd=10)
)
print(ch3_p2)</pre>
```

```
## id var1 var2 var3
```

```
## 1 1 10 NA 44.39524

## 2 2 NA 15 47.69823

## 3 3 30 25 65.58708

## 4 4 40 35 50.70508

## 5 5 NA 45 51.29288
```

# 9.4.2 Replace with 0

## 9.4.2.1 For a Specific Column:

```
ch3_p2.1<-ch3_p2
ch3_p2.1$var1[is.na(ch3_p2.1$var1)]<-0
print(ch3_p2.1)</pre>
```

```
## id var1 var2 var3

## 1 1 10 NA 44.39524

## 2 2 0 15 47.69823

## 3 3 30 25 65.58708

## 4 4 40 35 50.70508

## 5 5 0 45 51.29288
```

#### 9.4.2.2 For the Entire Dataset

```
ch3_p2.2<-ch3_p2
ch3_p2.2[is.na(ch3_p2.2)]<-0

print(ch3_p2.2)
```

#### 82CHAPTER 9. DATA MANAGEMENT - TIME SERIES AND PANEL DATA

```
## id var1 var2 var3

## 1 1 10 0 44.39524

## 2 2 0 15 47.69823

## 3 3 30 25 65.58708

## 4 4 40 35 50.70508

## 5 5 0 45 51.29288
```

## 9.4.3 Remove Rows or Columns with Missing Values

## 9.4.3.1 Remove Rows with Missing Values

```
ch3_p2.3<-ch3_p2
ch3_p2.3<-na.omit(ch3_p2.3)
print(ch3_p2.3)

## id var1 var2 var3
## 3 3 30 25 65.58708
## 4 4 40 35 50.70508</pre>
```

### 9.4.3.2 Remove Columns with Missing Data

```
ch3_p2.4<-ch3_p2
ch3_p2.4<-ch3_p2.4[, colSums(is.na(ch3_p2.4)) ==0]
print(ch3_p2.4)
```

```
## id var3
```

```
## 1 1 44.39524

## 2 2 47.69823

## 3 3 65.58708

## 4 4 50.70508

## 5 5 51.29288
```

## 9.4.4 Imputing Missing Values with the Mean

Here, we will impute missing values with the mean and unlike previous methods, this method uses a for function to loop through columns and check for columns with missing values. However, this method needs to have numeric format.

```
ch3_p2.5<-ch3_p2
for(col in names(ch3_p2.5)){
   if(is.numeric(ch3_p2.5[[col]])) {#Check if column is numeric
        ch3_p2.5[[col]][is.na(ch3_p2.5[[col]])]<-mean(ch3_p2.5[[col]], na.rm=TRUE)
   }
}
print(ch3_p2.5)</pre>
```

```
## id var1 var2 var3
## 1 1 10.00000 30 44.39524
## 2 2 26.66667 15 47.69823
## 3 3 30.00000 25 65.58708
## 4 4 40.00000 35 50.70508
## 5 5 26.66667 45 51.29288
```

#### 84CHAPTER 9. DATA MANAGEMENT - TIME SERIES AND PANEL DATA

#### 9.4.5 Note:

When doing the three methods, there are pros and cons.

- 1. Replacing with Zero can introduce bias if 0 is not realistic in the context of the data
- 2. Remove Missing Values can result in significant data loss
- 3. Imputing the Mean assumes the data is evenly distributed and can distort the variability in the data

Always make sure you should understand your data.

#### 9.4.6 Best Practice:

1. Always **explore** and **visualize** patterns first.

Leading to...

#### 9.4.7 Next Meeting:

1. Visualizing the data with base R package

#### 9.4.8 Final Note:

No Practical for this session; please work on the previous practical and the research problem to be submitted on January 24.

Next week, we will have a computer practical.
